

ChainWitness

Hardware-signed authenticity in a world of AI-generated content.

THE PROBLEM

Seeing is no longer believing

A fake takes seconds

Modern image generators produce photorealistic fakes faster than most people can check them.

Metadata proves nothing

EXIF data is invisible to viewers and stripped by almost every app a photo passes through.

No way to check

A viewer has no independent way to confirm when — or whether — a photo was really taken.

THE IDEA

A wallet that witnesses the moment

ChainWitness has your phone's camera and your own Solana wallet co-sign every photo, in the seconds right after the shutter closes — no gallery uploads, no later edits, nothing to fake after the fact.

HOW IT WORKS

From shutter to chain, in one motion

Every step but the last happens in the seconds after you press the shutter — the on-chain transaction is signed and broadcast before you ever leave the capture screen.

No backend ever holds a key

The wallet signs and sends it — not us

Every proof transaction is signed and broadcast by the user's own wallet, direct to Solana.

The backend only checks its work

It independently re-verifies each transaction against devnet — it never just trusts the client.

The proof survives us

If every one of our servers vanished tomorrow, every proof already on-chain would still check out.

Built with the phone, not ported to it

Mobile Wallet Adapter

Connect once; every proof and tip is signed the same way after.

Seed Vault on Seeker

Hardware-isolated signing when the connected wallet uses it.

In-app capture only

No gallery picker, so the timestamp can't be backdated.

Daily local reminder

A notification nudges a photo — no server scheduler needed.

Haptics throughout

Real tactile feedback on capture, tips and toggles.

Tested on real hardware

Built and verified on Seeker and everyday Android phones.

NOT A MOCKUP

It's real, and it runs today

Live on Seeker

Same feed, on Android

- ▶ **Tip in SOL, no middleman**
Straight to the poster's wallet, from the post itself.
- 📅 **Consecutive-day streak**
Computed from your own on-chain posting history.
- ☆ **Seeker Genesis Token badge**
Checked server-side against the real mint, on mainnet — visible above, on a real holder's post.
- 👤 **Open to browse**
A wallet is only needed to post or tip, never to look.

What this actually proves

✓ What's guaranteed

- The hash matches the exact bytes captured
- That wallet's key signed it — nothing else could
- The signature landed on-chain at that timestamp
- A backend independently re-checked all of it

⚠ What we don't claim

- That the camera wasn't pointed at a screen
- That the scene itself wasn't staged
- "Unfakeable" — a word we never use

Proof of **wallet, content and time** — a real, narrower guarantee, honestly stated, is worth more than a bigger claim we can't back up.

WHAT'S NEXT

Devnet was step one, not the ceiling

Mainnet

Same code, different cluster — the architecture never assumed devnet.

Surface hardware-backed signing

Show, not just assume, when a proof came from Seed Vault specifically.

A deeper social loop

More ways to react to a moment than a tip — without diluting the proof itself.

Public re-verification logic

It's small enough to audit. We want it open, not just "trust our server."

THANK YOU

Proof, signed by the person who was there
